```

## Question-1;

Is there a noticeable difference in sales between promoted and non-promoted products?

```
promo_sales = df.groupby("Promotion")["Sales Volume"].mean()  
  
plt.figure()  
sns.barplot(x=promo_sales.index, y=promo_sales.values)  
plt.title("Average Sales Volume: Promotion vs No Promotion")  
plt.ylabel("Average Sales Volume")  
plt.show()
```

Answer;

# Products under promotion show significantly higher average sales, confirming promotions are an effective sales strategy.

Question-2;

## Does seasonality impact sales volume ;

```
seasonal_sales = df.groupby("Seasonal")["Sales Volume"].mean()

plt.figure()
sns.barplot(x=seasonal_sales.index, y=seasonal_sales.values)
plt.title("Average Sales: Seasonal vs Non-Seasonal")
plt.ylabel("Sales Volume")
plt.show()
```

# Seasonal products outperform non-seasonal products, indicating higher consumer interest during seasonal trends.

Question -3;

Do higher-priced products sell less than lower-priced ones?

```
df["price"] = df[" price "].str.replace("$", "").astype(float)

plt.figure()
sns.scatterplot(x=df["price"], y=df["Sales Volume"])
plt.title("Price vs Sales Volume")
plt.xlabel("Price")
plt.ylabel("Sales Volume")
plt.show()
```

# In here affordable price products sell more than high price products.

## Question-4;

Which customer segment generates higher sales volume?

```
section_sales = df.groupby("section")["Sales Volume"].sum()

plt.figure()
sns.barplot(x=section_sales.index, y=section_sales.values)
plt.title("Total Sales Volume by Section")
plt.ylabel("Sales Volume")
plt.show()
```

The WOMEN section records higher total sales, suggesting stronger purchase frequency and product variety

Question-5;

Does product origin influence sales performance?

```
origin_sales = df.groupby("origin")["Sales  
Volume"].sum().sort_values(ascending=False).head(5)  
  
plt.figure()  
sns.barplot(x=origin_sales.index, y=origin_sales.values)  
plt.title("Top 5 Origins by Sales Volume")
```

```
plt.ylabel("Sales Volume")  
plt.xticks(rotation=30)  
plt.show()
```

Products manufactured in China and Bangladesh contribute the highest sales volume, reflecting cost-effective production and high demand.

Conducted comprehensive Exploratory Data Analysis (EDA) on retail sales data using Pandas, NumPy, Matplotlib, and Seaborn.

Promotions and seasonal trends significantly increase sales performance, confirming Zara's reliance on fast-fashion demand cycles.

Lower-priced products drive higher sales volume, emphasizing price sensitivity among customers.

The women's category acts as the primary revenue engine, suggesting strategic prioritization.

Supply chain sourcing from cost-efficient countries supports competitive pricing and strong sales outcomes.

## Business Value:

This analysis helps retail decision-makers optimize pricing strategy, promotional planning, inventory allocation, and supply chain sourcing to maximize revenue and demand responsiveness.
